Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

10/615,651

Applicant(s)

ZHOU, PU

Examiner

Monica A. Huson

Art Unit

1732

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 23 January 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-11, 13, 14 and 35-39 is/are pending in the application.
- 4a) Of the above claim(s) 14 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-11, 13 and 35-39 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 09 July 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

This office action is in response to the RCE filed 23 January 2006.

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1, 11, 13 and 35-39 are rejected under 35 U.S.C. 102(e) as being anticipated by Noone et al. (U.S. Patent 6,591,472).

Regarding Claim 1, Noone et al., hereafter “Noone,” show that it is known to carry out a method of forming a catheter (Abstract) comprising providing a braid layer having a distal end and a proximal end, an inner lubricious liner positioned within the braid layer (Column 8, lines 33-34, 49-50); securing a first polymer segment over the braid layer, the first polymer segment being positioned proximal of the distal end of the braid layer, the first polymer segment having a distal end and a proximal end (Column 9, lines 16-17); cutting through the braid layer and the inner lubricious liner at a cutting position proximate the distal end of the first polymer segment and removing a portion of the braid layer that extends distally of the cutting position (Figures 5-6); and securing a second polymer over the braid layer, the second polymer segment extending

Art Unit: 1732

over the first polymer segment and extending distally of the cutting position (Column 9, lines 19-20; Column 12, lines 55-61).

Regarding Claim 11, Noone shows the process as claimed as discussed in the rejection of Claim 1 above, including a method wherein the second polymer segment comprises in combination a proximal segment configured to overlay the braid layer, an intermediate segment configured to overlay the first polymer segment, and a distal segment configured to form a distal tip (Figure 8, element 75, 145).

Regarding Claim 13, Noone shows the process as claimed as discussed in the rejection of Claim 1 above, including a method wherein providing the braid layer comprises providing a braid layer that extends sufficiently distally of the cutting position to substantially prevent braid flaring at the cutting position (Figure 5, element 70).

Regarding Claim 35, Noone shows that it is known to carry out a method of forming a catheter (Abstract), comprising cutting a catheter subassembly at a cutting location (Figure 5, location 125), the subassembly having proximal and distal ends, an inner layer (Figure 5, element 65), a reinforcement layer on the inner layer (Figure 5, element 70), and a securement layer disposed over at least a portion of the reinforcement layer (Figure 5, element 100); removing the inner layer, the reinforcement layer, and the securement layer distally of the cutting location (Figure 6); and securing a polymeric outer segment over at least the securement layer such that a portion of the polymeric outer segment extends distally past the distal end of the cut subassembly (Figure 8, element 75, 145).

Regarding Claim 36, Noone shows the process as claimed as discussed in the rejection of Claim 35 above, including a method further comprising forming a portion of the polymeric outer segment into a distal tip for the catheter (Figure 8, element 25).

Regarding Claim 37, Noone shows the process as claimed as discussed in the rejection of Claim 35 above, including a method further comprising assembling the catheter subassembly by providing an inner subassembly having the reinforcement layer disposed on the inner layer (Figure 5, elements 65, 70); and disposing the securement layer on the inner subassembly by securing a securement segment thereon (Figure 5, element 100).

Regarding Claim 38, Noone shows the process as claimed as discussed in the rejection of Claim 37 above, including a method wherein the reinforcement layer has a distal end, the securement layer has a distal end, and the step of disposing the securement layer on the inner subassembly is performed such that the distal end of the reinforcement layer extends distally beyond the distal end of the securement segment (Figure 5, elements 70, 100).

Regarding Claim 39, Noone shows the process as claimed as discussed in the rejection of Claim 35 above, including a method wherein the reinforcement layer comprises a braided member (Column 8, lines 49-51).

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 2-5, 7, and 9-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noone, in view of Wilson (U.S. Patent 5,951,929).

Regarding Claim 2, Noone teaches the invention of claim 1 as discussed above, but does not expressly teach that the first polymer segment has a melting point that is at least about 10<sup>0</sup>F above a melting point of the second polymer segment. Wilson teaches using a blend of PEBA and approximately 30% BASO<sub>4</sub> (column 8, lines 32-33), which melts at a range of 385-400<sup>0</sup>F as the second polymer segment (column 8, lines 60-62) and ANRITEL™ as the first polymer segment, which melts at a temperature of 425<sup>0</sup>F (column 9, lines 21-36). Thus, Wilson teaches that the first polymer segment has a melting point that is at least 10<sup>0</sup>F (25<sup>0</sup>F) above the melting point of the second polymer segment. It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Wilson's materials during Noone's method in order that the first polymer segment will not remelt upon application of the second polymer segment (Wilson, column 9, lines 41-50).

Regarding Claim 3, Noone shows the process as claimed as discussed in the rejection of Claim 1 above, but he does not show using shrink tubes. Wilson shows that it is known to carry out a method wherein securing the first polymer segment comprises positioning a heat shrink tube over the first polymer segment and applying sufficient heat and pressure to melt the first polymer segment (Column 7, lines 57-67; Column 8, lines 1-5). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Wilson's heat shrink tube during Noone's method in order to most efficiently bond the materials together.

Regarding Claim 4, Noone shows the process as claimed as discussed in the rejection of Claim 1 above, but he does not show using shrink tubes. Wilson shows that it is known to carry

Art Unit: 1732

out a method wherein securing the second polymer segment comprises positioning a heat shrink tube over the second polymer segment and applying sufficient heat and pressure to melt the second polymer but not enough heat to melt the first polymer segment (Column 8, lines 52-65). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Wilson's heat shrink tube during Noone's method in order to most efficiently bond the materials together.

Regarding Claim 5, Noone shows the process as claimed as discussed in the rejection of Claims 1 and 4 above, but he does not show specific melting points. Wilson teaches that the first polymer segment has a melting point that is greater than about 400°F and the second polymer segment has a melting point that is less than about 400°F. Wilson teaches using a blend of PEBA and approximately 30% BASO<sub>4</sub> (column 8, lines 32-33), which melts at a range of 385-400°F as the second polymer segment (column 8, lines 60-62) and ANRITEL™ as the first polymer segment, which melts at a temperature of 425°F (column 9, lines 21-36). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Wilson's specific materials for Noone's method in order for the final article to have the specific end-use chemical and physical properties.

Regarding Claim 7, Noone shows the process as claimed as discussed in the rejection of Claim 1 above, but he does not show a specific material. Wilson teaches the first polymer segment comprises a polyether-ester elastomer (column 9, lines 20-25). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Wilson's specific materials for Noone's method in order for the final article to have the specific end-use chemical and physical properties.

Regarding Claim 9, Noone shows the process as claimed as discussed in the rejection of Claim 1 above, but he does not show a specific material. Wilson teaches the heat shrink tube comprises a perfluoro (ethylene-propylene) copolymer (column 8, lines 50-54). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Wilson's specific materials for Noone's method in order for the final article to have the specific end-use chemical and physical properties.

Regarding Claim 10, Noone shows the process as claimed as discussed in the rejection of Claim 1 above, but he does not show a specific material. Wilson teaches the heat shrink tube comprises a perfluoro (ethylene-propylene) copolymer (column 8, lines 50-54). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Wilson's specific materials for Noone's method in order for the final article to have the specific end-use chemical and physical properties.

Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Noone and Wilson, further in view of Zadno-Azizi (US 2004/0015150). Noone teaches the invention of claim 4 as discussed above, but fails to explicitly teach that the second polymer segment has a melting point that is about 350<sup>0</sup>F. Zadno-Azizi teaches a catheter outer coating (PEBAX) that has a melting point at about 350<sup>0</sup>F (paragraph 0177). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use a material with Zadno-Azizi's specific melting point for Noone's method in order for the final article to have the specific end-use chemical and physical properties.

Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Noone, in view of Ashiya et al (5,947,925), as stated in the paper mailed 21 September 2005. Noone teaches the invention of claim 1 as discussed above but fails to explicitly teach that the second polymer segment comprises a acetal resin/polyurethane blend. Ashiya et al., hereafter "Ashiya," teaches the second polymer segment comprises a acetal resin/polyurethane blend (column 6, lines 40-61, polyoxymethylene is an acetal resin). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Ashiya's specific material for Noone's method in order for the final article to have the specific end-use chemical and physical properties.

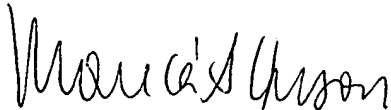

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Monica A. Huson whose telephone number is 571-272-1198. The examiner can normally be reached on Monday-Friday 7:30am-5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mike Colaianni can be reached on 571-272-1196. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
